DATE MAILED: 04/18/2006

Please find below and/or attached an Office communication concerning this application or proceeding.

## Office Action Summary

**Application No.**

10/658,871

**Applicant(s)**

KJELLBERG, RIKARD M.

**Examiner**

Brian J. Assessor

**Art Unit**

2114

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

### Status

- 1) ☒ Responsive to communication(s) filed on 09 September 2003.
- 2a) ☐ This action is **FINAL**.                      2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

### Disposition of Claims

- 4) ☒ Claim(s) 1-24 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-24 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 09 September 2003 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

### Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All    b) ☐ Some \*    c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

### Attachment(s)

## DETAILED ACTION

### ***Claim Rejections - 35 USC § 102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-18 are rejected under 35 U.S.C. 102(b) as being anticipated by Brown (4.710.926).

As per claim 1, Brown teaches:

A method comprising:

maintaining a plurality of processes of a particular service type in a processing system; (Brown column 3, lines 56-59; each processor runs a process and all are the same service type.)

assigning a status to each of the processes, from among a plurality of prioritized statuses, the plurality of prioritized statuses including an active status and a non-active status; (Brown column 4, lines 55-65)

causing each of the processes to monitor the other processes of said service type; (Brown column 7, lines 5-11; each processor maintains a list of the states of each other processor which is monitoring.)

causing each of the processes to respond autonomously to a predetermined condition by changing its own status between active and non-active. (Brown column 7, lines 19-31; when a processor fails the other processors check to see if they are the spare processor for the failed process and if it is then it takes over for the failed processor.)

As per claim 2, Brown teaches:

A method as recited in claim 1, wherein the predetermined condition involves another process of the particular service type. (Brown column 7, lines 27-31; the processes check their SpareGroup table to determine if they should take over for a failed process.)

As per claim 3, Brown teaches:

A method as recited in claim 2, further comprising causing each of the processes independently to maintain a list of other participant processes in the processing system. (Brown column 7, lines 5-11; each processor keeps track of heartbeats received/not received.)

As per claim 4, Brown teaches:

A method as recited in claim 3, wherein the plurality of processes includes an active process and a non-active process corresponding to the active process, each

independently maintaining said list. (Brown column 7, lines 5-11; each processor keeps track of heartbeats received/not received or active/non-active.)

As per claim 5, Brown teaches:

A method as recited in claim 4, wherein the non-active process can autonomously change its status to active in response to an event affecting the active process. (Brown column 7, lines 23-31; each process has a list of which processors it takes over for, and can be in a non-active state when this occurs. Figure 5, from stand-by to active)

As per claim 6, Brown teaches:

A method as recited in claim 1, further comprising:

causing each of the processes to send heartbeat messages to each other process; (Brown column 7, lines 3-5)

causing each of the processes to listen for heartbeat messages from other processes; (Brown column 7, lines 9-11)

causing each of the processes to update its list of participant processes based on receipt of heartbeat messages from other processes; (Brown column 7, lines 9-11)

causing each of the processes to update its list of participant processes based on the lack of receipt of heartbeat messages from other processes from which heartbeat messages have previously been received. (Brown column 7, lines 19-23; the table is updated once the Pulse Count is reduced to zero.)

Art Unit: 2114

As per claim 7, Brown teaches:

A method as recited in claim 1, further comprising assigning a unique process identifier to each of the processes, wherein each process determines its status based on its unique process identifier. (Brown column 4, lines 43-45)

As per claim 8, Brown teaches:

A method as recited in claim 7, wherein each process determines its status based on the value of its unique process identifier relative to the value of the unique identifier of each other process. (Brown column 4, lines 43-45; with respect to arrangement 100)

As per claim 9, Brown teaches:

A method comprising:

introducing a plurality of processes into a processing system, each of the processes having a service type; (Brown column 3, lines 56-59; each processor runs a process and all are the same service type.)

assigning a status to each of the processes, each said status selected from among a plurality of prioritized statuses, (Brown column 4, lines 55-56) including a primary status (Brown column 4, lines 56-57) and a standby status, (Brown column 4, lines 57-59) such that at least one of the processes is a primary process and at least

Art Unit: 2114

one of the processes is a standby process for the primary process; (Brown column 4, lines 55-59)

maintaining each of the processes so that each of the processes monitors its own status and the status of each other process of the same service type (Brown column 7, lines 3-11; each processor listens for others heartbeats and/or lack of heartbeats.) and can change its status from standby to primary without the user of a master, in response to an external event relating to a process of said same service type. (Brown column 7, lines 27-31; figure 5 shows the process from stand-by to active is done automatically.)

As per claim 10, Brown teaches:

A method as recited in claim 9, further comprising causing each of the processes to maintain a list of other participant processes in the processing system. (Brown column 7, lines 5-11; each processor keeps track of heartbeats received/not received.)

As per claim 11, Brown teaches:

A method as recited in claim 9, further comprising assigning a unique process identifier to each of the processes, wherein each process determines its status based on its unique process identifier. (Brown column 4, lines 43-45)

As per claim 12, Brown teaches:

Art Unit: 2114

A method as recited in claim 11, wherein each process determines its status based on the value of its unique process identifier relative to the value of the unique identifier of each other process of the same service type. (Brown column 4, lines 43-45; with respect to arrangement 100)

As per claim 13, Brown teaches:

A method comprising:

introducing a plurality of processes into a processing system, each process having a service type; (Brown column 3, lines 56-59; each processor runs a process and all are the same service type.)

causing each of the processes independently to maintain a list of other participant processes in the processing system. (Brown column 7, lines 9-11)

assigning a unique process identifier to each of the processes; (Brown column 7, lines 5-8)

causing each of the processes to send a heartbeat message repeatedly to each other process; (Brown column 7, lines 3-5)

causing each of the processes to listen for heartbeat messages from other processes; (Brown column 7, lines 9-11)

causing each of the processes to update its list of participant processes based on receipt of heartbeat messages from other processes; (Brown column 7, lines 9-11)

causing each of the processes to update its list of participant processes based on the lack of receipt of heartbeat messages from other processes from which heartbeat

Art Unit: 2114

messages have previously been received; (Brown column 7, lines 19-23; once the Pulse Count is decremented to zero the table will be updated.)

enabling each of the processes to select a status for itself, from among a plurality of prioritized statuses, including a primary and a standby status, without the use of a master, such that the plurality of processes includes a primary process and a standby process for the primary process. (Brown column 4, lines 55-65; each active processor has a processor to act as a stand-by, and the transition from stand-by to active, as can be seen in figure 5, is automatic.)

As per claim 14, Brown teaches:

A method as recited in claim 13, wherein for each process, the selection of status is based on the value of the unique process identifier of said process relative to the value of the unique process identifier of other processes having the same service type as said process. (Brown column 4, lines 43-45; with respect to arrangement 100)

As per claim 15, Brown teaches:

A processing system comprising:

a plurality of processes, each process having a service type; (Brown column 3, lines 56-59; each processor runs a process and all are the same service type.)

means for assigning a status to each of the processes, each said status selected from among a plurality of prioritized statuses, (Brown column 4, lines 55-56) including an active status (Brown column 4, lines 56-57) and a standby status, Brown column 4,

Art Unit: 2114

lines 57-59) such that at least one of the processes is a primary process and at least one of the processes is a standby process for the primary process; (Brown column 4, lines 55-59)

means for maintaining each of the processes so that each of the processes monitors its own status and the status of each other process of the same service type (Brown column 7, lines 3-11; each processor listens for others heartbeats and/or lack of heartbeats.) and can autonomously change its status from standby to primary in response to an external event. (Brown column 7, lines 27-31; figure 5 shows the process from stand-by to active is done automatically.)

As per claim 16, Brown teaches:

A processing system as recited in claim 15, further comprising means for causing each of the processes to maintain a list of other participant processes in the processing system. (Brown column 7, lines 5-11; each processor keeps track of heartbeats received/not received.)

As per claim 17, Brown teaches:

A processing system as recited in claim 15, further comprising means for assigning a unique process identifier to each of the processes, wherein each process determines its status based on its unique process identifier. (Brown column 4, lines 43-45)

Art Unit: 2114

As per claim 18, Brown teaches:

A processing system as recited in claim 15, wherein each process determines its status based on the value of its unique process identifier relative to the value of the unique identifier of each other process of the same service type. (Brown column 4, lines 43-45; with respect to arrangement 100)

***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 19-24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Brown (4,710,926) in view of Li (5,473,599).

As per claim 19, Brown teaches:

A method comprising:

maintaining a plurality of processes in a processing system, each process having an ability to independently monitor a status of each other process of said plurality of processes, without the use of a master; (Brown column 7, lines 5-11)

Brown fails to explicitly disclose a method causing said plurality of processes to interact with each other to establish a priority of status, such that each of said plurality of

Art Unit: 2114

processes can alter the priority of another of said plurality of processes without the use of a master to enable said interaction or alteration of priority.

In column 2, lines 44-46; Li teaches a method for establishing a priority status of devices throughout a system. It would have been obvious to a person of ordinary skill in the art at the time of invention to include the priority status method as taught by Li, in order to create a more efficient stand-by takeover system. This would have been obvious because Li clearly teaches that the above system is better suited for a more simplistic device failover within a network. (Li column 2, lines 9-12)

As per claim 20:

A method as recited in claim 19, wherein said interaction and said alteration amongst said plurality of processes is used to enable fault tolerance for at least one of said processes in said processing system. (Li column 2, lines 15-40; shows an organized system for setting the primary device on a network, through means of priority.)

As per claim 21:

A method as recited in claim 19, wherein said status is one of: primary, to become primary, or standby. (Li column 2, lines 44-46; a higher priority router takes over the primary status of the existing lower priority router.)

As per claim 22:

Art Unit: 2114

A method as recited in claim 19, wherein said priority is based on a value of an identifier assigned to each of said plurality of processes. (Li column 3, lines 2-5)

As per claim 23:

A method as recited in claim 22, wherein said priority is further based on the status assigned to each of said plurality of processes. (Li column 3, lines 2-5)

As per claim 24, Brown teaches:

A method for providing fault tolerance in a processing system, the method comprising:

enabling a plurality of processes in a processing system each to broadcast a periodic heart-beat message, wherein said heart-beat message includes an identifier for each of said plurality of processes; (Brown column 7, lines 5-11)

enabling each of said plurality of processes to receive each said heart-beat message; (Brown column 7, lines 5-11)

causing each of said plurality of processes to maintain an individual record of said plurality of processes; (Brown column 7, lines 5-11)

causing each of said plurality of processes to update said individual record based on said heart-beat messages; (Brown column 7, lines 5-11)

assigning each of said processes with a status, wherein said status is one of: primary, to become primary, or standby; (Brown column 4, lines 55-59)

Art Unit: 2114

enabling said plurality of processes to negotiate a hierarchy of control amongst each other based on the broadcast and receipt of heart-beat messages by each of said plurality of processes, (Brown column 7, lines 3-5)

Brown fails to explicitly disclose a method wherein said hierarchy of control is based on the status of each of said plurality of processes.

In column 2, lines 44-48; Li teaches a method for establishing a priority status of devices throughout a system. It would have been obvious to a person of ordinary skill in the art at the time of invention to include the priority status method as taught by Li, in order to create a more efficient stand-by takeover system. This would have been obvious because Li clearly teaches that the above system is better suited for a more simplistic device failover within a network. (Li column 2, lines 9-12)

### ***Conclusion***

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Brian J. Assessor whose telephone number is (571) 272-0825. The examiner can normally be reached on M-F 8:30-5:30.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Scott Baderman can be reached on (571)272-3644. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Art Unit: 2114

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
